

AMENDMENTS TO THE CLAIMS

1. (currently amended) Mobile lifting device comprising a mobile frame with a lifting device for receiving a cargo thereon which is provided with a weighing device with a display panel for displaying a determined weight of the cargo, wherein the weighing device comprises a non-load bearing pressure or strain-sensitive sensor which is connected firmly to an existing part of the frame and which is able to determine a mechanical deformation in that part of the frame and generate this as electronic signal.
2. (previously presented) Mobile lifting device as claimed in claim 1, wherein the lifting device comprises a set of lift forks and that the sensor is arranged on a part of the frame which mutually connects the lift forks.
3. (previously presented) Mobile lifting device as claimed in claim 1 wherein the sensor is arranged on a substrate and that the substrate is provided with means for a firm connection to said part of the frame.
4. (previously presented) Mobile lifting device as claimed in claim 3, wherein the sensor is glued to the substrate and that the substrate is connected to the frame by means of a manually releasable connection.
5. (previously presented) Mobile lifting device as claimed in claim 1, wherein the sensor comprises a strain gauge which is coupled by electronic means to the display panel.

6. (previously presented) Mobile lifting device as claimed in claim 1, wherein the display panel is able to give a weight designation in the form of a variable set of discrete indicators, each representing a fixed weight quantity adapted to the measurement accuracy of the weighing device.

7. (previously presented) Mobile lifting device as claimed in claim 6, wherein the indicators comprise light-emitting diodes which are coupled to the sensor in an electronic circuit.

8. (previously presented) Mobile lifting device as claimed in claim 6, wherein the indicators comprise contrasting surfaces in a liquid crystal display panel.

9. (previously presented) Mobile lifting device as claimed in claim 6, wherein in the display panel at least one zone of indicators is marked as such.

10. (currently amended) Mobile lifting device as claimed in claim 1, wherein the display panel is arranged together with ~~possible additional electronics~~ in a housing and that the housing also comprises the sensor and is connected firmly via the sensor to an existing part of the mobile lifting device.

11. (currently amended) Weighing device for a mobile lifting device comprising a housing provided with a display panel, ~~possible additional electronics~~, including an electrical power

supply, and a non-load bearing pressure or strain-sensitive sensor, which is provided with mounting means for mounting on a structural part via the sensor.
